

# Diabetes - Baseline Scenario

## Sample scenario card

This scenario card records one scenario as an explicit set of changes applied to the reference parameter set.

### Identity

|                         |                                                   |
|-------------------------|---------------------------------------------------|
| Model                   | Diabetes                                          |
| Scenario                | Diabetes - Baseline Scenario                      |
| Scenario ID             | diabetes-baseline                                 |
| Reference parameter set | reference-parameter-set:ncd-diabetes:synthetic-v1 |

### Scenario content

The source scenario contains 73 named parameters and 163 explicit target-path changes. It is applied after the model is first materialised from the reference parameter set.

### Internal validity

The card is generated from the scenario registry, so each listed change has a source path and value. Runtime comparison evidence is stored in the run JSON rather than repeated in full here.

### Face validity

This sample card is mainly a readability check for the new grammar. It should be reviewed against the clinical or policy intention of the scenario before being treated as signed-off.
